3 Safety instructions, Maintenance instruction,

3.1 Safety instructions for repairs

Figure 3-1

1. Safety regulations require that during a repair:
 - the set should be connected to the mains via an isolating transformer;
 - safety components, indicated by the symbol (see fig. 3.1), should be replaced by components identical to the original ones;
 - when replacing the CRT, safety goggles must be worn.

2. Safety regulations require that after a repair the set must be returned in its original condition. In particular attention should be paid to the following points.
 - As a strict precaution, we advise you to resolder the solder joints through which the horizontal deflection current is flowing, in particular:
 - all pins of the line output transformer (LOT);
 - fly-back capacitor(s);
 - S-correction capacitor(s);
 - line output transistor;
 - pins of the connector with wires to the deflection coil;
 - other components through which the deflection current flows.

Note: This resoldering is advised to prevent bad connections due to metal fatigue in solder joints and is therefore only necessary for television sets older than 2 years. The wire trees and EHT cable should be routed correctly and fixed with the mounted cable clamps.

- The insulation of the mains lead should be checked for external damage.
- The mains lead strain relief should be checked for its function in order to avoid touching the CRT, hot components or heat sinks.
- The electrical DC resistance between the mains plug and the secondary side should be checked (only for sets which have a mains isolated power supply). This check can be done as follows:
 - unplug the mains cord and connect a wire between the two pins of the mains plug;
 - set the mains switch to the on position (keep the mains cord unplugged!);
 - measure the resistance value between the pins of the mains plug and the metal shielding of the tuner or the aerial connection on the set. The reading should be between 4.5 MW and 12 MW;
 - switch off the TV and remove the wire between the two pins of the mains plug.
- The cabinet should be checked for defects to avoid touching of any inner parts by the customer.

3.2 Maintenance instruction

It is recommended to have a maintenance inspection carried out by a qualified service employee. The interval depends on the usage conditions:

- When the set is used under normal circumstances, for example in a living room, the recommended interval is 3 to 5 years.

- When the set is used in circumstances with higher dust, grease or moisture levels, for example in a kitchen, the recommended interval is 1 year.
- The maintenance inspection contains the following actions:
 - Execute the above mentioned 'general repair instruction'.
 - Clean the power supply and deflection circuitry on the chassis.
 - Clean the picture tube panel and the neck of the picture tube.

3.3 Warnings

1. ESD

All ICs and many other semiconductors are susceptible to electrostatic discharges (ESD). Careless handling during repair can reduce life drastically. When repairing, make sure that you are connected with the same potential as the mass of the set by a wristband with resistance. Keep components and tools also at this same potential.

- Available ESD protection equipment:
 - anti-static table mat (large 1200x650x1.25mm) 4822 466 10953
 - anti-static table mat (small 600x650x1.25mm) 4822 466 10958
 - anti-static wristband 4822 395 10223
 - connection box (3 press stud connections, 1 M ohm) 4822 320 11307
 - extension cable (2 m, 2 M ohm; to connect wristband to connection box) 4822 320 11305
 - connecting cable (3 m, 2 M ohm; to connect table mat to connection box) 4822 320 11306
 - earth cable (1 M ohm; to connect any product to mat or connection box) 4822 320 11308
 - complete kit ESD3 (combining all 6 prior products - small table mat) 4822 310 10671
 - wristband tester 4822 344 13999

2. In order to prevent damage to ICs and transistors, all high-voltage flashovers must be avoided. In order to prevent damage to the picture tube, the method shown in Fig. 3.2 should be used to discharge the picture tube. Use a high-voltage probe and a multimeter (position DC-V). Discharge until the meter reading is 0V (after approx. 30s).
3. Together with the deflection unit and any multipole unit, the flat square picture tubes used from an integrated unit. The deflection and the multipole units are set optimally at the factory. Adjustment of this unit during repair is therefore not recommended.
4. Be careful during measurements in the high-voltage section and on the picture tube.
5. Never replace modules or other components while the unit is switched on.
6. When making settings, use plastic rather than metal tools. This will prevent any short circuits and the danger of a circuit becoming unstable.
7. Wear safety goggles during replacement of the picture tube

3.4 Notes

1. The direct voltages and oscilloscopes should be measured with regard to the tuner earth, or hot earth as this is called (see fig. 3.3)
2. The direct voltages and oscilloscopes shown in the diagrams are indicative and should be measured in the Service Default Mode (see chapter 8) with a colour bar signal and stereo sound (L:3 kHz, R:1 kHz unless stated otherwise) and picture carrier at 475.25 MHz.

3 Safety instructions, Maintenance instruction,

L7.2E

5

3. Where necessary, the oscillograms and direct voltages are measured with and without aerial signal. Voltages in the power supply section are measured both for normal operation and in standby. These values are indicated by means of the appropriate symbols (see fig. 3.3).
4. The picture tube PWB has printed spark gaps. Each spark gap is connected between an electrode of the picture tube and the Aquadag coating.
5. The semiconductors indicated in the circuit diagram and in the parts lists are completely interchangeable per position with the semiconductors in the unit, irrespective of the type indication on these semiconductors.

Figure 4-1

5 Repair facilities

L7.2E

7

5.1 Test points

The PWB boards have service printing on both sides. In the service printing test points are included. These test points are referring to the electrical function as mentioned below:

Test point Electrical function

- A1,A2, etc.: Audio
- C1,C2, etc.: Control
- F1,F2, etc.: Frame drive and frame output
- L1,L2, etc.: Line drive and line output
- P1, P2,etc.: Power supply
- S1,S2- etc.: Synchronisation
- V1,V2, etc.: Video

The numbering is done in a for diagnostics logical sequence.

Example: Checking the power supply, start with test point P1, P2 etc.).

5.2 Service mode

The service mode is split into two parts:

- Service Default Mode (SDM).
- Service Alignment Mode (SAM).

5.2.1 Entering and leaving SDM and SAM

1. Entering SDM

- To entry the SDM , there are two possibilities:
 - Via the "DEFAULT" button on the DST (Dealer Service Tool)
 - Via short circuiting the service pins 0025 and 0024 (mass), while switching on the set via the mains switch. For 0025 and 0024 see Diagram A4 and the PWB drawing of the main panel.
- In the SDM mode a S (in green) and the SDM menu (in red) is displayed.(see Fig.6.1).

2. Entering SAM

- To entry the SAM , there are two possibilities.
 - Via the "ALIGN" button on the DST (Dealer Service Tool)
 - Via short circuiting the Service pins M28 and M29 (mass), while switching on the set via the mains switch. For M28 and M29 see Diagram A4 and the PWB drawing of the main panel.
- In the SAM mode a S (in green) and the SAM main menu (in red) is displayed.(see Fig.6.2).

Remark: After the set is in the SDM or SAM mode the short circuit can be removed.

5.2.2 Leaving SDM or SAM

To leave the SDM or SAM mode , push the stand-by button on the remote control

Remark: After switching off and on by the mains switch , the set remains in the SDM or SAM mode.

5.3 Initial states

The initial state after switching on in the SDM or SAM mode is:

System:

- For Multi-Europe setsPAL-BG
- For Multi-France setsSECAM-L

Tuning:

- For sets with VST tuner: Programme number 1 is selected .

Further settings:

- The automatic switch off (no IDENT) timer and the sleep timer will be ignored.
- The child lock will be disabled.
- If the TV set was in hotel mode, this mode is disabled as long as the TV is in SDM or SAM mode.
- Brightness, saturation, sharpness, contrast and balance are initialised on 50% level.
- The volume is set to 25% level.
- The TV set is normally controllable.
- All displayed text in SDM and SAM menu are in English.

5.4 SDM (Service Default Mode)

5.4.1 SDM menu

Below in Fig.6.1 an example of the SDM menu is shown.

Between clamps a short explanation of each item is added.

001E (life timer)	2.17.6 (software indication)	S (service mode indication)
AS (option abbreviation)	ON (option status)	
ERR (error)	0 0 0 0 0 (error buffer)	
OPT (option)	36C8 B805 2401 (12 digit option code)	

Fig.6.1

Below a more detailed information of each item is given

5.4.2 Life timer

The indication is in hexadecimal notation. Each hour the set is switched on (not standby) the number is incremented by 1. Also each time the set is switched on the number is incremented by 1.

5 Repair facilities

5.4.3 Software indication number.

For each software change this number will be changed.

5.4.4 Service mode indication.

The S indicates that the set is in SDM or SAM mode.

5.4.5 ERROR and ERROR buffer

(ERR refers to the "ERROR BUFFER")

00000 represent the contents of the so called "ERROR BUFFER". This buffer consist of 5 digits. In each digit an ERROR code can be displayed. The last five errors, are stored in the EEPROM, and are shown in this buffer. An error will be added to the buffer if this error differs from the last error in the buffer. The last detected error is displayed on the most left digit.

Example: Suppose the display shows: 3 4 1 3 1. This means the last found error is error code 3; the last found error but one is error code 4, etc.

Remark: The ERROR BUFFER is erased when the set is switched from SDM or SAM in stand by , or via code 99 via DST.(Dealer service Tool).

The following error codes have been defined:

Error code	Error description	Possible defective component
0	No error	
1	Internal RAM error of æC	IC7600
2	General I2C error	
3	EEPROM Configuration error (Checksum error)	Set not correct configured
4	I2C error audio processor	MSP3410 on NICAM panel
5	I2C error TV processor	TDA8373/74
6	EEPROM error	ST24C04
7	I2C error PLL tuner	PLL tuner
8	POR bit high (43-IC7600)	

5.4.6 ERROR code indication via blinking stand by LED

The ERROR codes 2, 5 and 8 are also indicated via blinking of the stand by LED. This is important if no OSD function or picture is available.

The method is to show LED blinks as many as the error code.

Example: Error code 5 will result in five blinks (0.25 seconds ON and 0.25 seconds OFF).

After this sequence the LED will be OFF for 3 seconds.

5.4.7 Option abbreviation and Option status.

To select another option abbreviation use the MENU UP/DOWN buttons and to change the status use the MENU LEFT/RIGHT buttons.

Elucidation:

With above items the option statuses stored in the EEPROM can be changed.

This is necessary if the EEPROM is replaced by a fresh EEPROM, because a fresh EEPROM is initial loaded with default options and statuses by the microcomputer. The options stored in the factory can differ per type and stroke number. Therefore it is necessary to load the EEPROM with the correct statuses These options with statuses are indicated on a sticker glued on the CRT. For an example of the sticker see table 6.1 (this table is valid for 21PT1663/00).

Table 6.1

Option abbreviation	Status
AT	ON
AV	ON
BA	ON
BL	ON
CO	OFF
GM	ON
HO	ON
MT	PH
PG	ON
PR	99
SA	ON
SB	IN
SP	ON
SS	ON
SU	ON
SY	EW
TR	ON
UH	OFF
VI	OFF
XT	ON

(Table only valid for 21PT1663/00)

Loading a fresh EEPROM

- Switch on the TV via the power switch.
- Audio mute the TV (to get no big noise).
- Change the option statuses as indicated on the sticker on the CRT.
- Put TV in stand by via the remote control.
- Switch on the TV again via the remote control.

5 Repair facilities

L7.2E

9

- Switch OFF the TV via the power switch
- Switch on the TV again via the power switch.

In table 2 all the possible option abbreviation with full option name and possible statuses for "Europe" sets are listed. The status can be "ON", "OFF" or can have another indication.

Table 2 : Options

Option abbr	Option full name	Status possibilities
AT	Auto tuning system	ON/OFF
AV	AVL	ON/OFF
BA	Bass	ON/OFF
BL	Balance	ON/OFF
CO	Clock In Menu	ON/OFF
GM	Game mode	ON/OFF
HO	Hotel mode	ON/OFF
MT	Menu type	PH = Philips
		NB = National brand
		MV = Magnavox
PG	Program guide	ON/OFF
PR	Presets	99
		59
		79
SA	Spatial	ON/OFF
SB	Sound Board	IN = ITT NICAM
		IT = ITT 2CS
		MA = MONO ALL
		MM = Multi Mono
SP	Smart picture	ON/OFF
SS	Smart Sound Full	ON/OFF
SU	Surf	ON/OFF
SY	System Cluster	EW = Europe West
		EE = Europe East
		EM = Europe Manual
		SS = Single System
TR	Treble	ON/OFF
UH	UHF only	ON/OFF
VI	Virgin Mode	ON/OFF
XT	EXT 2 Available	ON/OFF

5.4.8 OPTION code

OPT is the abbreviation of OPTION, this abbreviation refers to the following 12 digit hexadecimal option codes (36C8 B805 2401)

The option code can not be selected. It only give a quick indication in hexadecimal form of the options settings of the relevant set.

5.5 SAM (Service Alignment Mode)

Via the SAM, service software alignments can be executed.

When entering SAM a main menu is displayed. Via the main menu sub menus can be selected.

5.5.1 SAM main menu (see Fig. 6.2)

In the main menu the items of the basic software alignments are indicated.

The items can be selected with the UP(+)/DOWN(-) arrow keys on the remote control. Entry into the sub menus is executed with the VOL.(+)/VOL.(-) arrow keys.

SAM MAIN MENU

S	
AKB	ON
TUN.FOA	ON
TUN.FOB	ON
EXT.FOA	ON
EXT.FOB	OFF
TUNER	>
WHITE TONE	>
GEOMETRY	>

Fig.6.2

Below each item is explained.

5.5.2 AKB (Auto Kine Biasing)

With the option AKB the "black current loop" can be enabled or disabled

ON =enabled, OFF = disabled.

5.5.3 TUNER Speed setting.

With the items TUN.FAO and TUN.FOB the speed (time constant) for internal signals is set. The speed can be set to normal, slow or fast.

Table 3: Options for Tuner Speed settings

5 Repair facilities

TUN.FOA	TUN.FOB	Speed
OFF	OFF	Normal
OFF	ON	Slow
ON	X	Fast

5.5.4 EXTERNAL A/V Speed setting

With the items EXT.FAO and EXT.FOB the speed (time constant) for external signals is set. The speed can be set normal, slow and fast.

Table 4: Options for External AV Speed settings

EXT.FOA	EXT.FOB	Speed
OFF	OFF	Normal
OFF	ON	Slow
ON	X	Fast

5.5.5 Tuner

Below an example of the sub menu Tuner is shown.

Tuner	S
AGC	23
F-PLL	3
IF PLL L'	0
AFW	240 KHz
AFA	0
AFB	1

Item AGC:

For the setting of the item AGC see RF AGC adjustment paragraph 8.1.4 of chapter 8.

Item IF-PLL, IF-PLL L ACCENT, AFW, AFA and AFB,

When the main signal processor IC TDA8373/74 is changed, the IF-PLL and IF-PLL L ACCENT need to be realigned

For the settings of IF-PLL, IF-PLL L ACCENT and AFW see the picture demodulator adjustments paragraph 8.1.5 of chapter 8.

Remark: AFA and AFB are adjusting indicators and therefore not selectable.

5.5.6 White tone

Below an example of the white tone sub menu and the derived "WARM", "COOL" and "NORMAL" sub menus are given. With these menus the WARM, COOL and NORMAL colour temperatures can be changed.

MAIN WHITE TONE MENU

S	
WARM	<
COOL	<
NORMAL	<

WARM TEMPERATURE SUB MENU

WARM	S
RED	39
GREEN	39
BLUE	25

COOL TEMPERATURE SUB MENU

COOL	S
RED	39
GREEN	39
BLUE	25

NORMAL TEMPERATURE SUB MENU

NORMAL	S
RED	39
GREEN	39
BLUE	25

Remark:

Only one of the 3 items (RED, GREEN or BLUE) will be displayed on the screen. Via "scrolling with the UP/DOWN keys the items can be changed.

The item's red, green or blue can be changed by first pressing the control left/right keys to highlight the desired setting. With the desired setting high lighted, the user can increment or decrement the setting by using the control up/down key. All

5 Repair facilities

L7.2E

11

changed data are stored into the EEPROM after returning to the SAM main menu via the OK key.

The initial default value for all setting is 37.

The factory settings of the colour temperatures are:

WARM; R = 45, G = 32, B = 26

NORMAL; R = 37, G = X, B = Y

COOL; R = 37, G = 32, B = 31

Remark: In NORMAL position the values X (G) and Y (B) are adjusted for 8500K colour temperature.

5.5.7 GEOMETRY

The geometry menu contains the following information:

S	
HSH	25
VSL	32
VAM	23
SC	13
VSH	27

Upon enter into the picture geometry menu, the first item will be highlighted.

The value can be incremented or decremented by pressing the control right or left key.

The rest of the parameters can be scrolled through by using the control up/down keys.

All changed data will be stored into the EEPROM after returning to the service main menu via the OK key.

Abbreviation explanation

- HSH - Horizontal shift
- VSL - Vertical linearity
- VAM - Vertical amplitude
- SC - S-correction
- VSH - Vertical shift

5.6 Use of Dealer Service Tool (DST)

With the SDM, under mentioned extra service features can be executed

- Direct entering SDM via the "DEFAULT" button on the DST.
- Direct entering SAM via the "ALIGN" button on the DST.
- In case of no (OSD) picture the error buffer can be read out using the "BLINKING LED" procedure (see also paragraph 6.7) by pressing the "DIAGNOSE" button on the DST.

Remark:

- Entry of the SDM and SAM via the DST is possible in all states, except from stand-by.

- All software is suspended till the DST mode is left.
- The dealer mode status is left if the stand-by command is received

5.7 Hotel-mode

Entering the hotel-mode :

- Select channel 38
- Push the menu button on the local keyboard (vol. + & vol. -) and the OSD-button of the RC simultaneously for 3 seconds.
- The screen shows the "HOTEL MODE SUB MENU "ON". Via this menu the wanted blanked channels can be selected.

Leaving the hotel mode :

- Same as entering the hotel mode.
- The screen shows the "HOTEL MODE SUB MENU "OFF".

Remarks:

- In the HOTEL mode the Installation menu cannot be entered.
- When entering the hotel mode the maximum volume will be the current value.
- The set will always switch to a selectable channel when set is switched on.

HOTEL MODE SUB MENU "ON"

38	HOTEL ON
EXIT	>
HOTEL CHANNEL	38

HOTEL MODE SUB MENU " OFF "

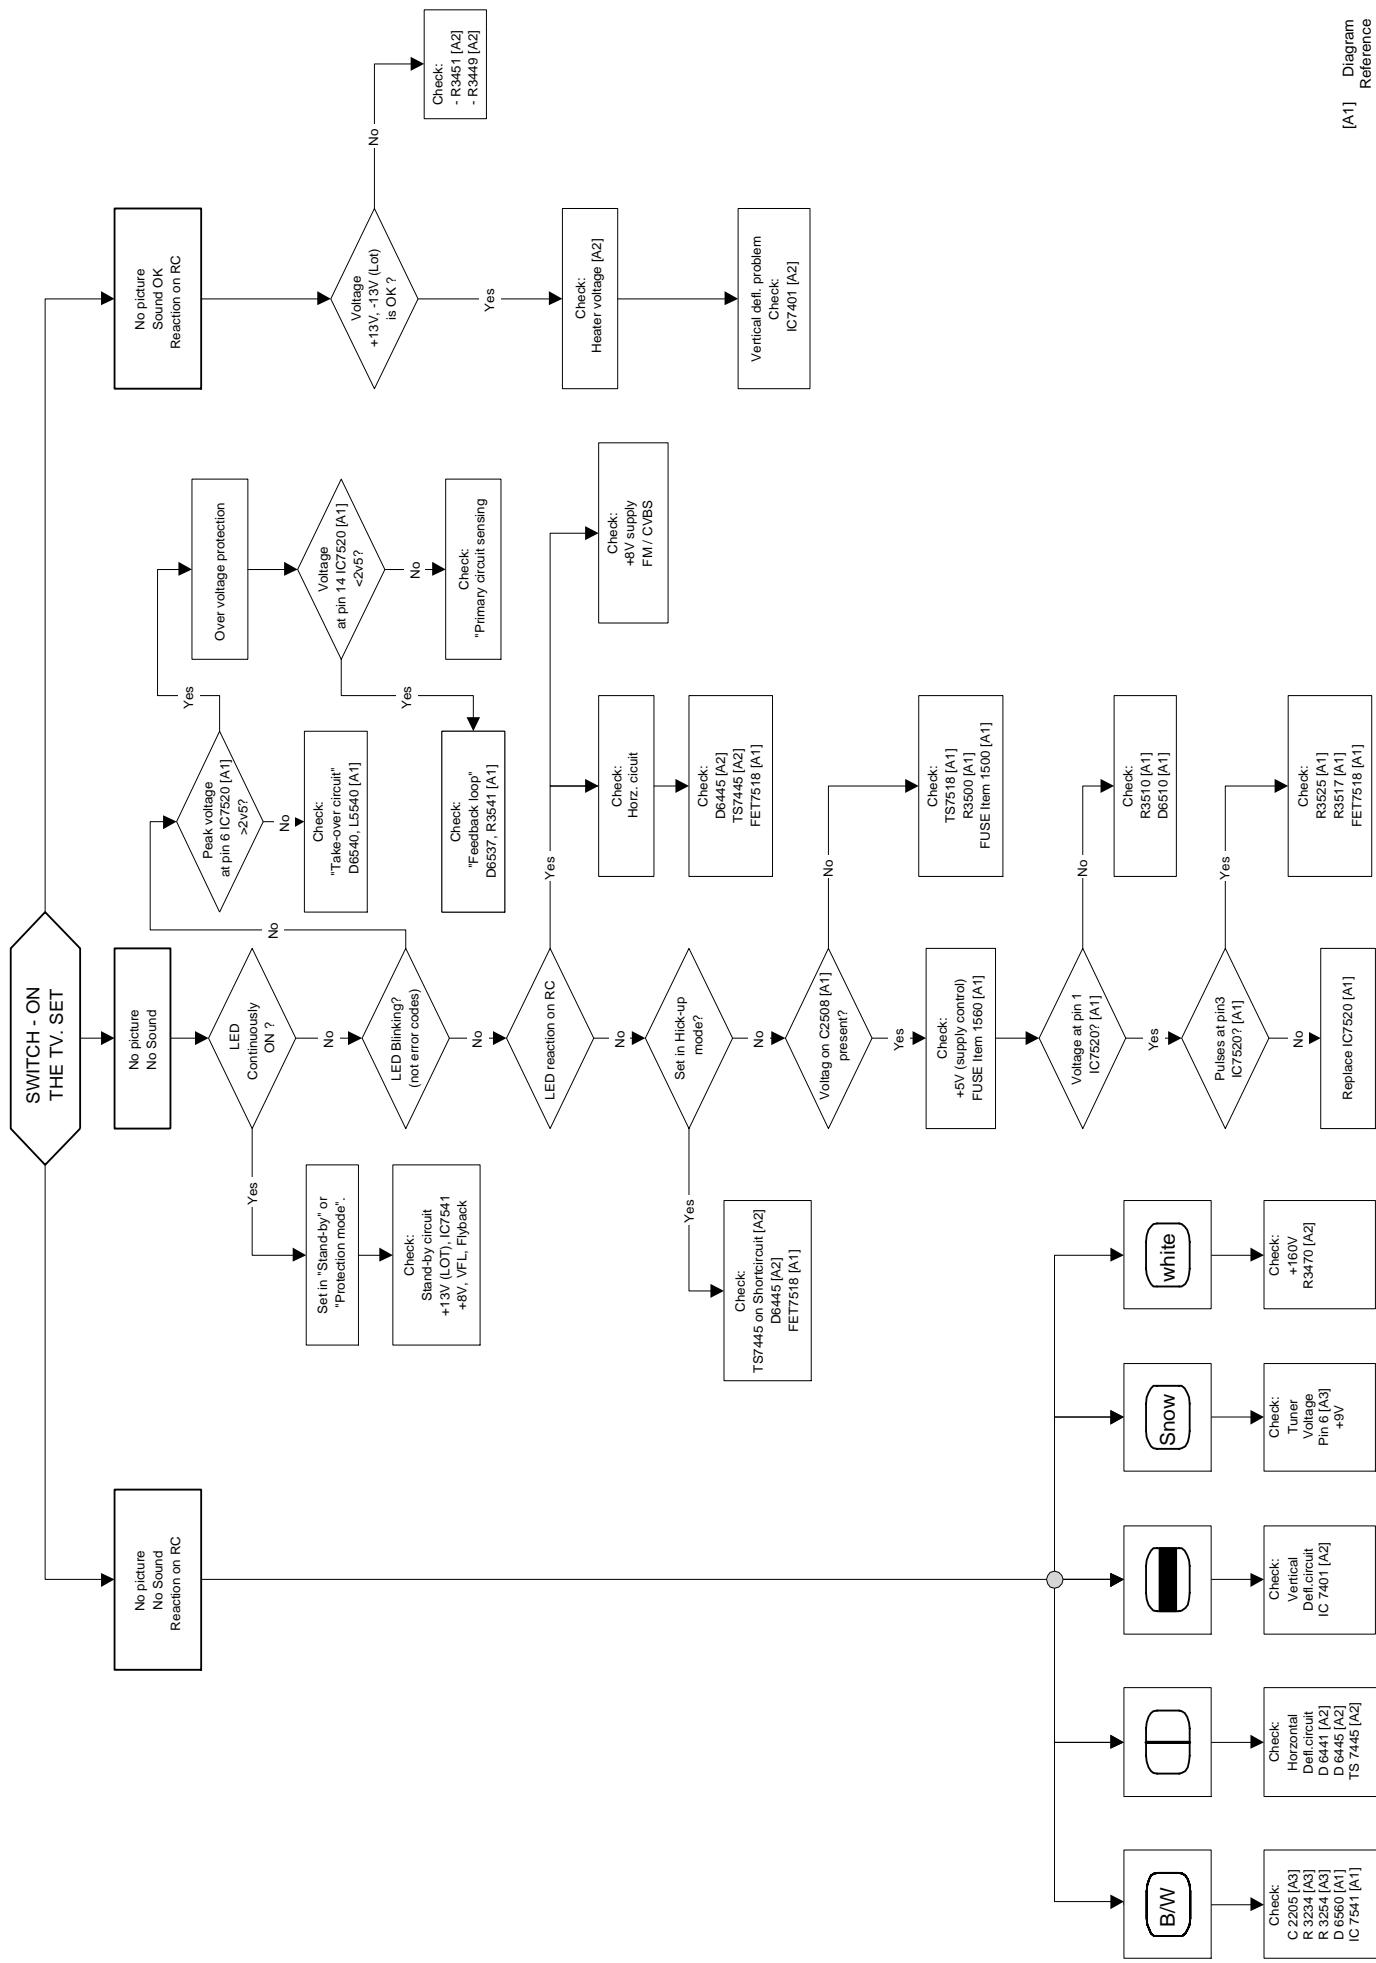

38	HOTEL OFF
----	-----------

Remark: The Hotel mode can only be activated if the Hotel mode option status (HO=ON), see table 2.

SOUND PROCESSING + SOUND INTERFACE

Note:

Unless stated otherwise, the supply voltage used is:
220V to 240V +/- 10%, 50 - 60 Hz +/- 5%.

Voltage and wave forms are measured in respect to earth.

Remarks:

- Never use the heatsink as earth.
- Where in the adjustment a pattern generator is mentioned, a colour pattern generator PM5418 has been used with an RF output voltage of 1mV.
- For some adjustments the set has to be put in the SAM (Service Alignment Mode).
- When in the text "Enter SAM" is mentioned proceed as follows:
- Enter SAM by Dealer Service Tool (button "ALIGN"), or via short-circuit the service pins 0028 and 0029 on the main PCB while switching on the set via the mains switch.
- The SAM menu is displayed when the SAM mode is entered (see also chapter 5).

8.1 Settings on the main chassis panel

8.1.1 (95V supply voltage (17", 21")

- Connect a multi meter (DC) across C2551.
- Set brightness and contrast to minimum
- Tune to a colour-bar test signal
- Apply a colour bar pattern.
- Adjust potentiometer R3540 to:
 - 96.7V +/- 1V for 21" sets
 - 100V +/- 1V for 17" sets.

8.1.2 Geometry adjustments (software adjustment)

- Apply a cross hatch pattern
- Enter SAM.
- Enter into GEOMETRY menu.
- The value of the geometry settings can be decrement or increment by pressing the right or left key on the remote control.

Remark: Before doing the geometry alignment HSH,VSH and VAM, set first item VS (vertical slope) to 25 and SC (Vertical S-correction) to 13 for 21" and to 15 for 17".

* Horizontal centring

Select item HSH for horizontal shift.

* Vertical centring

Select item VSH for vertical shift

* Picture height

Select item VAM for vertical amplitude .

8.1.3 Focusing

- Apply a cross hatch pattern.
- Set brightness and contrast at maximum.
- Adjusted with focusing potentiometer (upper knob of LOT 5445) for maximum sharpness of the picture.

8.1.4 RF-AGC adjustment (software adjustment)

- Apply a PAL colour bar pattern and set RF-frequency on 189.25MHz (output voltage 1mV).
- Enter SAM

- Enter into TUNER menu, select item AGC for RF AGC adjustment.
- Connect a multi-meter (DC) at pin 1 of the tuner.
- The "AGC" value can be increment or decrement by pressing the remote control right or left key. Adjust so that the voltage at pin 1 of the tuner is 5V (0.5V DC

8.1.5 Picture demodulator adjustment.

- Enter SAM .
- Enter into TUNER menu
- Connect a signal generator (PM5326) to pin 11 of the tuner
- * IF-PLL setting (for all versions)
 - Set generator signal to 38.9MHz (negative modulation).
 - Set AFW = 80 and adjust IF PLL until AFA = 1 and AFB is just switching from 1 to 0 or 0 to 1.
- * IF-PLL L ACCENT setting

- Set generator signal to 33.9MHz (positive modulation) in Band I & System L for Mono BGLI version
- Set generator signal to 34.0MHz (positive modulation) in Band I & System L for Nicam BGLI version.
- Set AFW = 80 and adjust IF PLL ACCENT until AFA = 1 and AFB is just switching from 1 to 0 or 0 to 1.

Remark: For IF PLL ACCENT adjustment, the set has to be tuned on system France, VHF 1 and varicap voltage <9V.

8.2 Vg2 and white-D settings

8.2.1 Vg2 cut off alignment

- Apply a black picture pattern.
- Connect an oscilloscope to the picture tube cathodes for red, green and blue. Set the oscilloscope to DC 50V/Div and 2ms/Div.
- Measure the DC level of the measuring pulses at the end of the frame blanking (see Fig. 8.1)
- Adjust the VG2 potmeter (lower knob on the LOT) so that the measuring pulses with the highest level are:
 - 140V +/- 2V for 21"
 - 130V +/- 2V for 17"

8.2.2 White-D adjustment (software adjustment)

- Enter into WHITE TONE menu, select item WARN, COOL or NORMAL, only one of the three items Apply a white raster pattern.
- Enter SAM (see chapter 6).
- (R, G or B) will be displayed on the screen.
- The initial default value for all setting is 37.
- The factory settings of the colour temperatures are :
 - WARM(R = 45, G = 32, B = 26)
 - NORMAL(R = 37, G = X, B = Y)
 - COOL(R = 37, G = 32, B = 31)

Remark: X and Y values in NORMAL setting are adjusted for 8500K colour temperature.

Introduction

For a quick overall view of all diagrams see the block diagram on sheet 4.

This chassis is executed with:

- A mains isolated SMPS (switched mode power supply)
- A single chip TV processor with software controlled picture geometry adjustments
- Micro computer with teletext function (execution depended)-
- Separate audio module (multi mono or NICAM) with output amplifier

9.1 Power supply (Diagram A1)

9.1.1 Mains input and degaussing

The mains voltage is filtered by L5500, L5501 and L5502, full wave rectified by a diode bridge (6502-6505) and smoothed by C2508. The DC voltage for the SMPS is applied at pin 7 of T5545 (e.g. 300V DC for 220V AC mains).

The degaussing current is applied via dual PTC resistor R3504. After switching "on" the set, the PTC is cold so low-ohmic and therefore the degaussing current is very high. During degaussing, the PTC is heated up and is getting high-ohmic, as a result the current through the PTC becomes very low.

9.1.2 Switched mode power supply

The switched mode power supply (SMPS) is mains isolated. The control device IC7520 (MC44603AP) delivers duty cycle controlled pulses for driving switching FET 7518. The pulses have a fixed frequency of 70 kHz in normal operation.

For a detailed block diagram of IC7520 (MC44603) see Fig. 9.1.

9.1.3 Start up and take over circuitry.

Via the start-up circuitry R3530 and R3529 one side of the 220V AC mains is used to start-up IC7520 via the supply pin (Vpin 1). As long as Vpin 1 has not reached 14V5, IC7520 does not start up and only sinks 0.3mA. As soon as Vpin 1 reaches the 14V5, IC7520 starts driving FET 7518 into conduction and pin 1 sinks a typical supply current of 17mA. This supply current can not be delivered by the start-up circuit, so a take-over circuit has to be available. If no take-over take's place, the voltage on pin 1 will decrease and IC7520 switches off. In that case the restart will start again. During start-up a voltage across winding 1 - 2 is built up. At the moment the voltage across winding 1 - 2 reaches approx. (12V, D6540 start conducting and takes over the supply voltage Vpin 1 of IC7520 (take over current is approx. 17mA).

9.1.4 Secondary output voltages sensing (pin 14 of IC7520)

Winding 1 - 2 has the same polarity as the secondary windings which are supplying the load. During the FET is not conducting the secondary windings and winding 1-2 are positive. D6537 conducts and charges C2537; the DC level across C2537 is a reference for the secondary output voltages e.g. the +95V((VBATT)). This control voltage (feedback voltage) is applied via voltage divider R3538, R3539 and potentiometer R3540 (for adjusting the +VBATT) to the error amplifier input IC7520 pin 14.

9.1.5 Primary current (I-prim) sensing (pin 7 of IC7520)

The current sense voltage Vpin 7 is a measure for the I-prim through FET 7518. The I-prim is converted into a voltage by R3518. The current sense voltage Vpin 7 is used to control both the secondary output voltages and the maximum I-prim.

9.1.6 Demagnetization control (pin 8 of IC7520)

The voltage across winding 1 - 2 has the same polarity as the voltage across the secondary windings. As a result the voltage across this winding is negative during the FET is conducting, and positive during the FET is not conducting. The so called demagnetization "DEMAG" function in IC7520 (input pin 8) is used for blocking the output Vpin3 during the time that there is still energy in the transformer (Isec not zero). This is realized by delaying the switch "on" point of the FET until the demagnetization is completely finished.

9.1.7 Standby mode

In the standby mode the load decreases under a certain threshold level. The SMPS is than switching to the so called "reduced frequency mode". The switching frequency is than reduced to 20 kHz. The minimal load threshold level is determined by R3532 connected to pin 12.

In normal operation mode the internal oscillator is adjusted at 70 kHz. This frequency is determined by C2531 and R3537 connected to pin 10 and pin 16 respectively of the IC7520.

In standby mode the internal oscillator is adjusted at 20 KHz. This frequency is determined by R3536 connected to pin 15 IC7520.

9.1.8 FET 7518 gate regulation

D6524 prevents pin 3 of IC7520 from becoming negative (this will destroy the IC) due to stray inductance in the gate part of the FET. The safety resistor R3525 limits the drive current to the gate of the FET 7518

9.1.9 Over voltage protection of the secondary voltages

After start-up is the supply voltage Vpin 1 taken over by positive winding 1 - 2, and so after start up Vpin 1 is a measuring point for the secondary output voltages. After start-up (via an internal switch) this Vpin 1 is internally tapped (voltage divided) to a voltage which can be measured at pin 6 (so Vpin 6 is also a measuring point for the secondary output voltages). As soon as the voltage Vpin 6 > 2V5 the logic in IC 7520 will shut down the output at pin 3. This 2V5 threshold at Vpin 6 is equivalent to a Vpin1 of 16V DC which is equivalent to a voltage at the supply voltage (VBATT of approx. 95V DC (normal operation) and 102V DC (standby). After switching "off" because of over voltage protection, the IC starts up again. In case an over voltage situation is sensed at the secondary output voltages, the SMPS will go in over voltage protection. In case the over voltage situation remains present, the SMPS will give over voltage protection slow-start, over voltage protection slow-start, etc. (a very good audible hick-up mode).

9.1.10 Undervoltage protection of the secondary voltages

If the supply voltage Vpin 1 < 9V DC the output pulse at pin 3 will be shut down. As soon as Vpin 1 < 7V5, the IC7520 will be totally shut "off". Vpin 1 of 9V DC is equivalent to a voltage at (VBATT of approx. 70V DC (normal operation) and 95V DC(standby). Vpin 1 of 7V5 is equivalent to a voltage at

9 Circuit diagram description

(VBATT of approx. 55V DC (normal operation) and 65V DC (standby).

In case an under voltage situation is sensed at the secondary output voltages, the SMPS will first switch "off" the pulse and then switch "off" the complete IC 7520.

In case the IC 7520 is switched "off", the SMPS will switch "off". In case the under voltage situation remains present, the SMPS will give under voltage protection, slow-start, under-voltage protection, slow-start, etc. (a very good audible hick-up mode).

9.1.11 Unload protection

In case the load goes down (e.g. the line deflection goes down because of standby mode or some failure in the line deflection circuit) this is detected by IC7520 via I-prim and secondary output voltages sensing. In case the load decreases below a certain threshold the SMPS will switch in "reduced frequency mode" of 20 kHz (this threshold is determined by the voltage level at pin 12 IC7520);

In case of an unload situation the set will switch to "low frequency mode" or standby mode. Whether this unload situation of the SMPS is caused by the standby command or by a failure (e.g. in the line circuit), can only be determined by switching on the set again which the remote control, in case of standby mode the TV will switch "on" again, in case of unload situation the set will not switch "on".

9.1.12 Overload (short-circuit) protection

If the secondary load becomes too high, I-prim becomes too high which is sensed by the current sense voltage Vpin 7. This voltage Vpin 7 is not allowed to exceed 1V DC by IC 7520 and so gives current limiting.

As the I-prim is limited, the secondary output voltages will also drop and so supply voltage Vpin 1 will drop. As soon as Vpin 1<9V DC the driving pulse at pin 3 will stop.

As a result of these 2 mechanism in case of an overload the secondary voltages will drop very fast. This is called the fold-back mechanism, the fold-back point can be adjusted by pin 5 IC7520 this point is adjusted to a maximum tolerable output power of 85W at 90V AC and 165W at 276VAC.

After this fold-back, the IC starts up again. In case the overload situation remains present, the SMPS will give fold back again, slow-start, fold-back, slow-start, etc.:

As a result in case of short-circuit (or overload) the TV will be in a very good audible hick-up mode.

9.1.13 Output voltages

- +VBATT (95V) used for the line output stage and the tuning system.
- 10V / 14V used for the audio amplifier.
- 14V used for the horizontal synchronization circuit and as input voltage for IC7541.
- +5V (pin 9 of IC7541).used for the control circuit The 5V is also available in the standby mode).
- +8V (pin 8 of IC7541) used for the video processing. The +8V output is determined by the voltage on pin 7 of IC 7541 This voltage is adjusted via voltage divider 3552 and 3554.

9.1.14 DC Output Voltages Protections

- +5V protection :When any overload for the +5V supply occurs (pin 1 of IC7541 < 6.5V) the protection circuit in IC7541 turns on. and shuts down the +5V supply. and also +8V supply.
- +8V protection : When any overload for the +8V supply occurs (pin 1 of IC7541 < 6.5V) the protection circuit in IC7541 turns on and shut down the output +8V supply. If the voltage on pin 7 is < 2.4V the +8V will also shut down.

9.2 Single chip TV-processor IC7225 (TDA8374)

Introduction :

In this chip most of the video, audio and sync circuits are integrated.

In the diagrams the IC is split up in next 5 parts (5A,5B,5C,5D and 5E).

- IC7225-5A, video detector (see diagram A3).
- IC7225-5B, source select en PAL demodulator (see diagram A3).
- IC7225-5C, video control (see diagram A3).
- IC7225-5D, horizontal and vertical synchronization (see diagram A2)
- IC7225-5E, mono sound FM demodulator (see diagram A5)

9.3 Micro computer (Diagram A4)

Two kinds of microprocessors are used, one with and one without teletext function. The (C with teletext (IC7600) is drawn in the diagram with the outer pin numbering. In case of no TXT a (C (IC7601) is used with fewer pins. This (C is drawn in the diagrams with the internal pin numbering. In case of the (C with integrated teletext function, the CVBS-TXT signal is fed to pin 23. The TXT and OSD information are combined at pins 32-33-34.

9.4 The line output circuitry (see diagram A2)

Pin 40 IC 7225-5D delivers the drive signal for the line output stage. Via TS7440 and TS7441 the drive signal is applied to the line output transistor 7445 and line output transformer (LOT) 5445. The line output stage supplies the line deflection current. Via secondary windings of the LOT the following supply voltages are generated:

- EHT voltage (25kV)
- Vg2 voltage
- Focus voltage
- Filament supply voltage (ff)
- (160V for RGB amplifiers on the CRT panel
- +5.5V for the control circuit and tuner supply
- + 9V for the tuner supply
- +13V for the control and vertical drive output circuit
- -13V for the vertical drive output circuit

9.5 Frame output circuitry

IC 7401 (TDA9302) is used for the vertical deflection. This IC is controlled on pins 1 and 3 by the vertical drive signal delivered by IC 7225-5D. The deflection current is generated on pin 5. The vertical fly-back voltage is generated on pin 3 of the IC.

9 Circuit diagram description

L7.2E

31

9.6 Protections

General: In the set next protections are build in:

9.6.1 Fast discharge circuit.

TS7420 and TS7421 (see diagram A1) formed a fast discharge circuit. When the voltage on the collector of TS7421 is >6V the circuit will switch off the horizontal drive immediately via pin 50 IC7225-5D (see diagram A2).

9.6.2 CRT flash protection.

The BCI information is applied to pin 42 of IC7225-5D.(diagram A2) If due to a flash in the picture tube the voltage on pin 42 is >6V, the horizontal drive is switched off immediately. If the voltage is again <6V the horizontal drive is switched on again.

9.6.3 EHT over voltage protection.

The BCI information is also applied to pin 50-IC7225-5D (diagram A2). First the BCI compensates vertical picture

amplitude variations due to beam current variations. The control range is between 1.2V and 2.8V. However if the voltage on pin 50 exceeds 3.9V the EHT over voltage protection is activated and the horizontal drive is switched off.

9.6.4 +13V protection

Protection input pin 16 of IC7600 (see diagram A4). If this pin is connected to ground, the set is switched in protection. At this pin the +13V is monitored via the circuit 7655,7608. The emitter of 7608 becomes "low" (0V7 lower than the base voltage) if the +13V drops. This will force pin 16 of the (C "low" and will switches the set in protection.

9.6.5 +13V and -13V protection

Vertical deflection output IC7401(see diagram A2) is supplied by +13V and -13V. When the current delivered by the +13V or -13V is increasing to much will this result in a voltage drop of <6.5V at pin 3 of the IC (VFL) . This voltage drop is applied to pin 37-IC7600 (micro computer). The micro-computer will place the set in the standby mode.

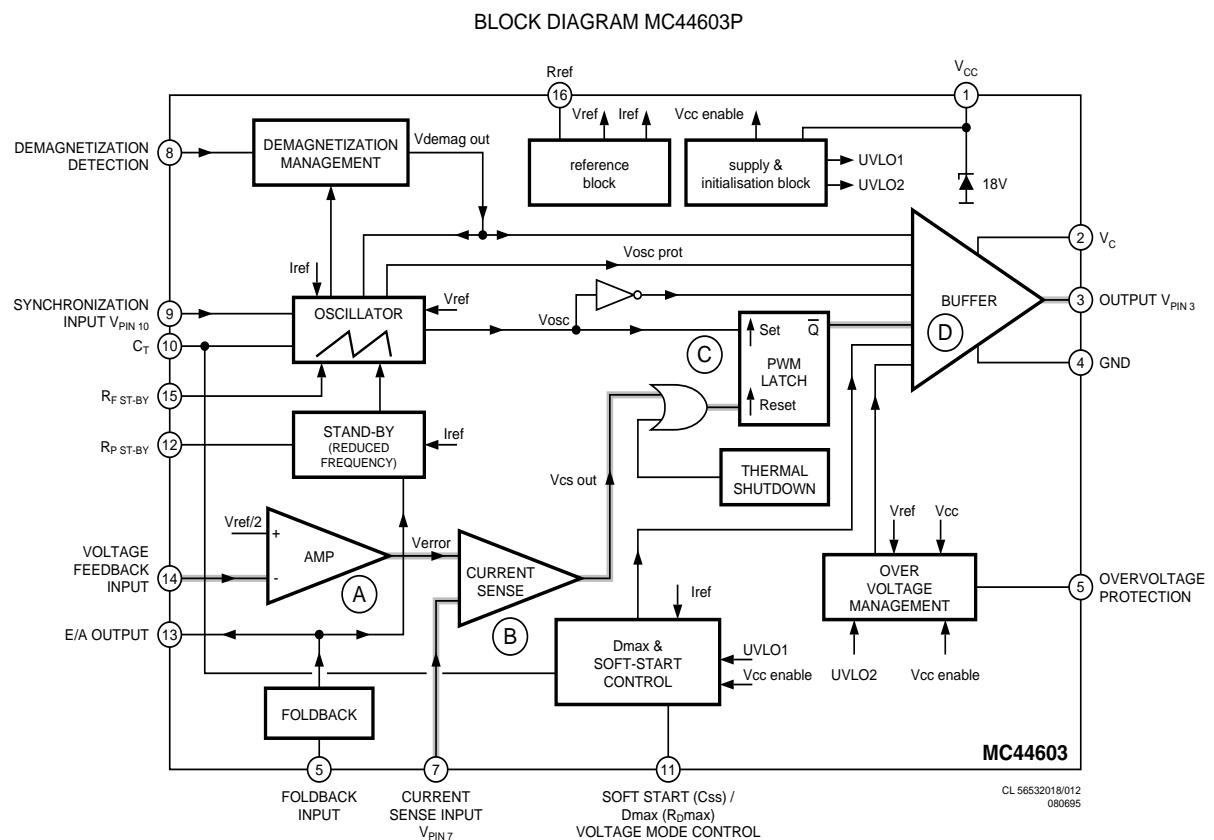

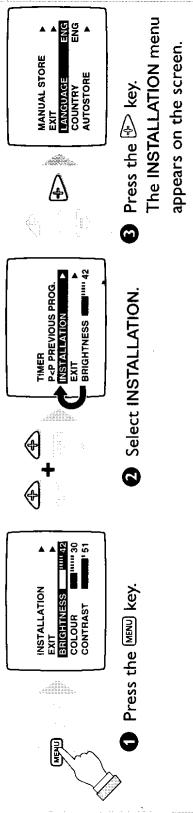

Figure 9-1

Introduction

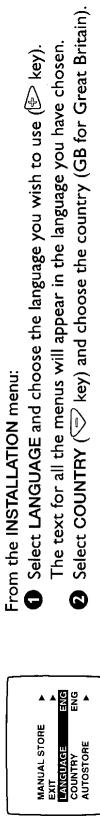

Thank you for purchasing this television set.
This handbook has been designed to help you install and operate your TV set.
We would strongly advise you read it thoroughly.
We hope our technology meets entirely with your satisfaction.

Tuning-in the TV channels

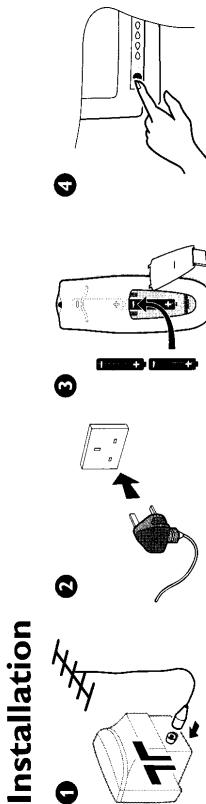

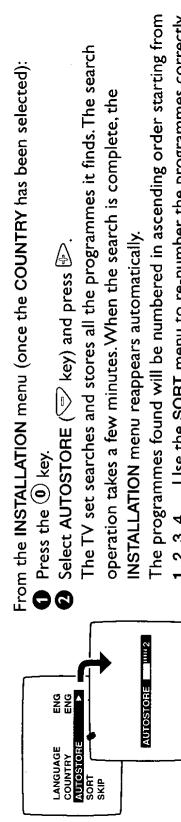

To call-up the Installation menu

Selecting the menu language and the country

Automatic store

Press the on/off key to switch on the television.
If the television remains in standby mode, press the P-[<] key on the remote control.

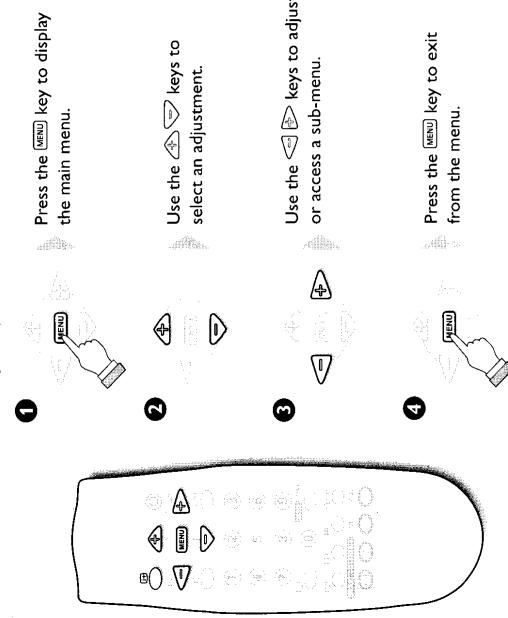

Insert the mains plug into the socket (220-240V/50Hz) at the rear of the set.

Insert the 2 LR03-type batteries (supplied) making sure they are the right way around.

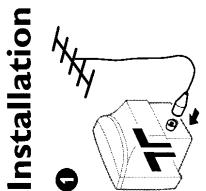

Remark: When you switch on the TV set for the first time, the INSTALLATION menu automatically appears on the screen.

Using the menus

The menus are displayed on the television screen. They are used to tune in the channels and to access all settings. They are used in the following way:

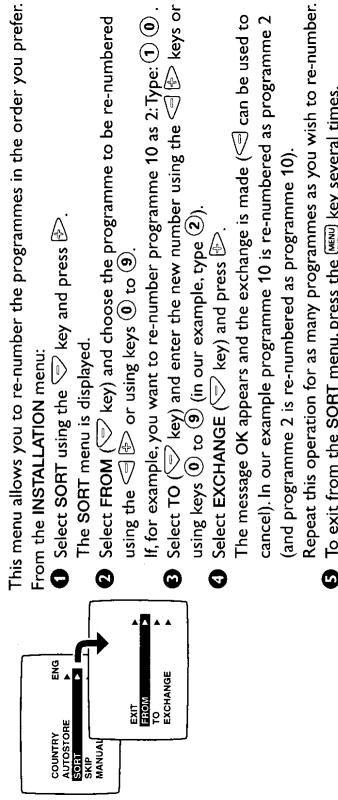

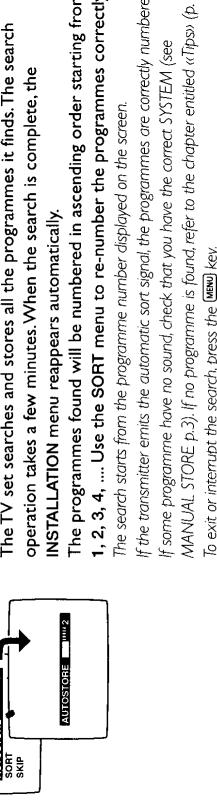

N.B.: The main menu automatically disappears after 30 seconds if no action is taken. The [+] key also allows you to exit the menus.

Insert the mains plug into the wall socket (220-240V/50Hz).

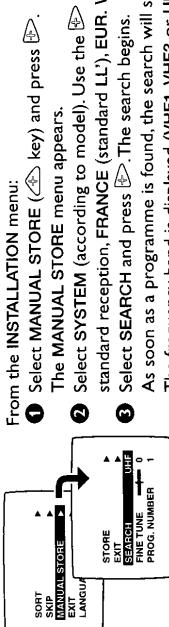

Remark: When you switch on the TV set for the first time, the INSTALLATION menu automatically appears on the screen.

Programme sort

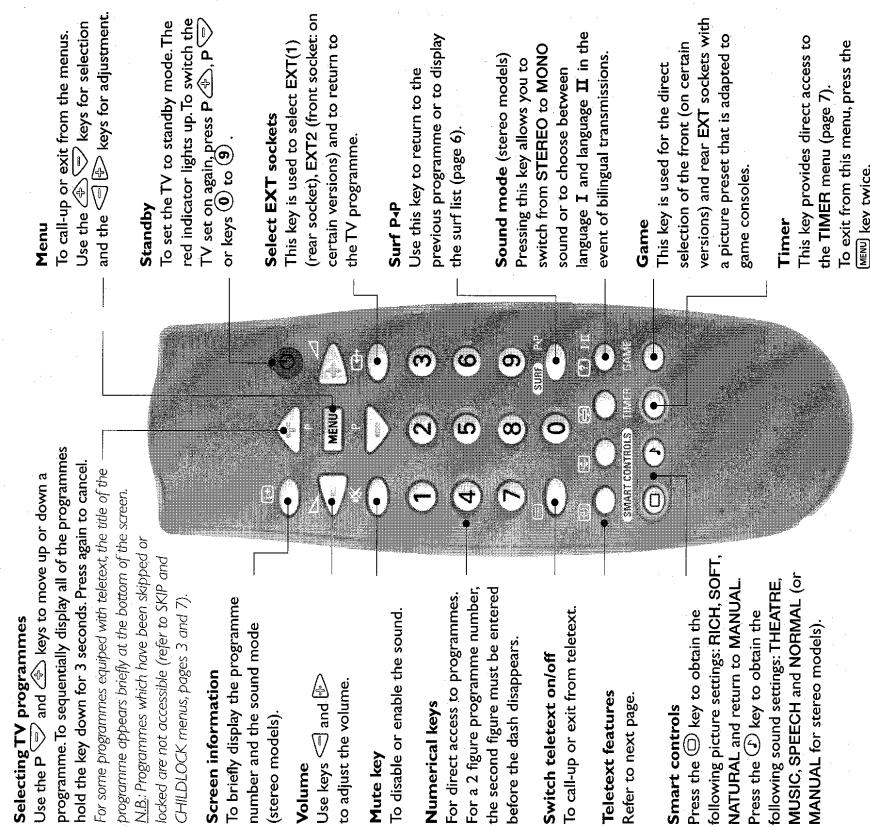

Manual store

This menu allows you to store each programme manually.

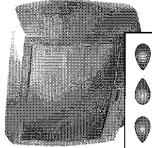

The remote control keys

To exit from the menus ...

Press the MENU key several times.

The keys on the TV set

The TV set has 4 keys (on some models these are located behind a flap).

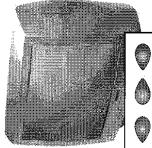

The VOLUME - + keys are used to adjust sound levels.

The PROGRAMME - + keys are used to select the required programmes.

To access the menus, hold down the VOLUME - and VOLUME + keys.

The PROGRAMME - + keys may then be used to select an adjustment and the VOLUME - + keys to make that adjustment.

To exit from the menus, select the EXIT item (by using the PROGRAMME - + keys) and press the VOLUME + key.

The TV set has 4 keys (on some models these are located behind a flap).

The VOLUME - + keys are used to adjust sound levels.

The PROGRAMME - + keys are used to select the required programmes.

To access the menus, hold down the VOLUME - and VOLUME + keys.

The PROGRAMME - + keys may then be used to select an adjustment and the VOLUME - + keys to make that adjustment.

To exit from the menus, select the EXIT item (by using the PROGRAMME - + keys) and press the VOLUME + key.

10 Direction for use

Using teletext

Other menu adjustments

Teletext is an information system, broadcast by certain TV channels, which can be consulted in the same way as a newspaper. It also provides subtitles.

Press:

②

Time display

Result:
When the teletext is switched off, press this key to display the time in the top right-hand corner of the screen.

The time is not displayed if the channel selected does not broadcast teletext.

To call-up or exit from teletext. The main index page presents a list of subjects to which you have access.

If the selected TV channel does not broadcast teletext, '100' is displayed and the screen remains black. If this is the case, switch off teletext and choose another TV channel.

Each subject has a corresponding 3 digit page number. Use keys ① to ⑨ to enter the page number required. E.g. page 120, type ① ② ③ . The number is displayed in the top left-hand corner of the screen, the page counter starts searching and then the page selected is displayed. Keys P and P allow you to access previous or following pages.

If > XXX < flashes briefly or the counter continues searching, this means that the selected page is not broadcast. If this is the case, choose another number. Coloured zones are displayed at the bottom of the screen. The 4 keys with coloured borders allow access to the subjects or their corresponding pages. The coloured zones flash when the page or the subject is not yet available.

Direct access to a subject

Press this key to display the upper part, the lower part and then to return to the normal page size.

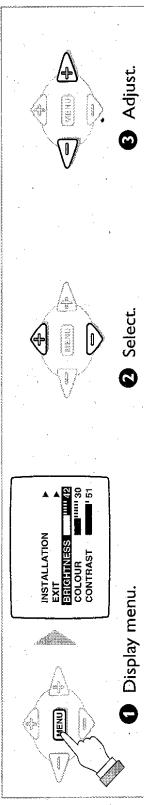

Enlarge a page
Direct selection of a sub-page

Certain pages have sub-pages which follow automatically. To access a sub-page directly, press the ② key. The page number is replaced by 4 dashes. Type the number of the sub-page required using 4 numbers, e.g. type 0002, to consult sub-page 2. The number of the current page reappears, the page counter searches and then the sub-page is displayed.

Stop the sequence of sub-pages
Reveal

Pressing this key enables and disables the sequence of sub-pages. The message  appears in the top left-hand corner of the screen.

Use this key to reveal/conceal hidden information (solutions to games).

Picture adjustment

Display the Picture menu. You can now access the adjustments for BRIGHTNESS, COLOUR, CONTRAST, SHARPNESS and COL. TEMP., which adjusts the colour temperature of the picture; COOL (blue white), NORMAL (balanced) or WARM (red white). CONTRAST PLUS, which enables clarity of the contrast.

Sound adjustment

Display the Sound menu. You can now set the VOLUME, and make the following adjustments for stereo equipment: BALANCE, TREBLE, BASS and SPATIAL; this function enhances the stereo effect, giving the impression that the speakers are positioned further apart. VOLUME LIMITER: this function is used for automatic level control in order to avoid sudden increases in volume (particularly when changing channels or during advertisements).

Storing adjustments

Storing is automatic; once an adjustment is made using the menus, it is stored automatically (this happens after 1 minute if no action is taken or as soon as an other programme is selected). The adjustments for the EXT sockets and for programmes 0 to 11 are stored individually; a different adjustment is possible for each of these programmes (except for the volume). The adjustments for programmes 12 to 99 are stored in the same way. To restore the factory picture adjustments, set the smart controls on NATURAL and modify one of the Picture menu items (this will automatically store the settings).

Surf function

This menu is used to select the function to be attributed to the P-P SURF key on the remote control. Display the menu, then:

- ① Select P-P and choose PREVIOUS PROG. or SURF LIST.
- ② Press the [menu] key to exit the menu.

PREVIOUS PROG. mode: the P-P SURF key on the remote control is used to access the last programme watched.

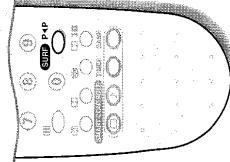

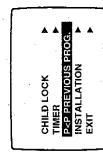

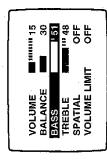

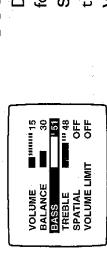

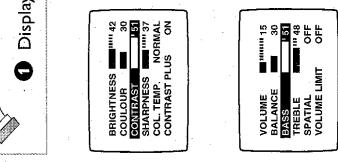

SURF LIST mode: the P-P SURF key is used to display a list of favourite programmes (maximum of 8). To store this list:

- ① Display one of your favourite programmes (e.g. number 4).
- ② Before the number disappears, press the P-P SURF key.

The SURF LIST message appears. The programme is stored.

- ③ Repeat operations ① and ② for each programme to be stored (e.g. programme No. 9, 1 and 12).
- ④ Use the P-P SURF key to access your favourite programmes directly (in our example Nos. 4, 9, 1 and 12).

To reset the surf list, set the P-P menu to PREVIOUS PROG and then to SURF LIST.

Connecting peripheral equipment

This menu allows you to program the TV to automatically switch on with the programme of your choice.

1 Display the menu, select TIMER and then press .

2 Select SET CLOCK and enter the time using keys **①** to **⑨**.
N.B.: Every time the TV is switched on the clock is automatically updated on the basis of the teletext information in programme No. 1.
If the TV set does not feature teletext, this update will not occur.

3 Select START TIME and enter the time at which you wish the TV to switch on.
4 Select PROGRAMME and enter the programme number required.
5 Select TIMER ACTIVE and set to ON. (OFF to disable).
6 Press twice on the  key to exit from the menu.

If you now switch the TV set to standby (

To cancel: Switch TIMER ACTIVE back to OFF.

N.B.: The programming will not function correctly if you use the on/off key on the front of the TV to switch off the TV set.

Sleeptimer

Display the menu, select SLEEPERTIMER and use the  key to enter the length of time after which the TV will switch to standby mode (up to 120 mins).

Press the  key on the remote control to display the length of time remaining.

Childlock

This menu allows you to lock the TV set and to disable access to certain or all of the programmes.

N.B.: When a programme is locked, the search function is no longer possible (the INSTALLATION menu is no longer accessible).

1 Display the menu, select CHILDLOCK and press 
The CHILDLOCK menu appears.
2 Select PROGRAMME and enter the number of the programme you wish to lock. To lock all programmes, select ALL using the 

The LOCK menu is replaced by a CODE menu.
The TV set is now locked. The locked programmes are no longer visible: a black screen appears with a LOCKED message.

To cancel: Select CODE and enter your confidential number:
selecting LOCK and then NO.
6 Press the  key to exit from the menu.

N.B.: The childlock will not function with EXT sockets that receive an RGB signal (most game consoles).
Should you forget your confidential code, enter the universal code 8888.

Rear connection

You can connect any equipment that has a euroconnector socket to your TV set (video recorder, decoder, etc.).

For further information on connecting a video recorder, refer to its user manual.

Front connections

When the headphones are connected, the sound on the TV set is automatically muted. Press keys  and  to adjust the volume.
Some models have AUDIO / AUDIO connections on front of the TV set.
There is 1 video input + 1 sound input (mono models) or 2 (L) and (R) sound inputs for stereo models. For a mono sound camcorder, connect the audio signal to the AUDIO L input. Use the I-II key to reproduce the sound on the left and right loudspeakers of the television.

To select the connected equipment

Use the  key on the remote control to select the EXT(1) (rear socket) or EXT(2) (front socket; on certain models).
Most equipment (decoder, video recorder) carries out the switching itself.
When a peripheral device provides RGB signals (game, satellite receiver,...), it has priority over the TV programmes. The peripheral device has to be switched off if you want to watch the TV channels. If you wish to avoid this inconvenience, configure the peripheral equipment to provide composite video signals (C/B/S PAL/SECAM) instead of RGB signals (refer to the peripherals' user manual).

Tips

Installation

To avoid any dangerous situations and operating faults, do not place anything on the TV set and leave a space of at least 5 cm around the appliance.

Impossible to call up the INSTALLATION menu?

The CHILDLOCK function is enabled (refer to page 5). To rapidly unlock all programmes, call up the CHILDLOCK menu and enter your confidential code.
Set the PROGRAMME item to ALL. Set the LOCK item to YES and then to NO.
All the programmes are now unlocked.

Poor reception or no picture?

The proximity of mountains or high buildings may be responsible for ghost, pictures, echoing or shadows. If this is the case, modify the orientation of the outside aerial and check that the TV channel is tuned in correctly (refer to FINE TUNE page 3).
Set the LOCK item to YES. The screen turns black. Repeat operations **②** and **③**. Set the PROGRAMME item to YES. Set the LOCK item to NO.
Are your aerial and euroconnector sockets correctly connected?
If the peripheral equipment connected to the EXT1 is on switch it off.

Standby

To save electricity it is advisable to switch the TV set off using the on/off key on the front of the set. If the set receives no signal for 15 mins, it automatically switches to standby mode.

Still no results?

If you have a problem with your TV set, never attempt to repair it yourself. contact your dealer's after-sales service.

Recycling directive

Your TV set uses materials which are reusable or which can be recycled.
To minimise the amount of waste in the environment, specialist companies recover used sets for dismantling and collection of reusable materials (consult your dealer).

11 Abbreviations

(R-Y)_OUT	R-Y output from chroma demodulator	RAM	Random Access Memory
uC	Microcomputer	RESET1	Reset signal for the uC
AQUA	Aquadag layer on the outside of the picture tube	RF_AGC	Automatic gain control signal I for tuner
AV_MUTE	Signal to mute the sound on the Audio-out cinch	RIGHT_OUT	Audio right out
AVL_AV2/AVL	Switching signal from UP to the Auto Volume leveller on the ITT on Panel	ROM	Read Only Memory
B_TXT OSD	Blue TXT or OSD signal from (C to the video controller IC7225-5C	SAM	Service Alignment Mode
BASS	Control signal for BASS	SANDCASTLE	Sand castle signal from IC7225-5D to delay line IC7255 and SECAM chrominance decoder IC7241.
BCI	Beam Current information	SCL	Clock line of the 12C-bus
BG/1_or_BG/0 K	Monochrome TV system sound carrier + 5.5MHz (BG), Sound carrier + 6MHz(I), Sound carrier + 6.5MHz(DK)	SDA	Data line of the 12C-bus
BL_TXT OSD	Fast blanking signal to IC7725-5C to display OSD and TXT	SDM	Service Default Mode; predefined mode for faultfinding
BLACKSTR_SW	Black stretch switch	SECAM_REF	SECAM reference
BS1	TV band selection 1 signal	SID/STA/LL	Sound identification / stereo available / France system "L"
BS2	TV band selection 2 signal	SIF	Sound IF signal for FM demodulator
CHROMA_O/ NTSC_SW	Switch on signal for NTSC chroma oscillator (3.575MHz)	STANDBY	Switching signal from microcomputer "low" for standby (power supply will be switched to stand-by mode), "high" for normal operation
CHROMA_1/BG/L	Switch on signal for BG/L chroma oscillator (3.582MHz)	TREBLE	Treble control signal
CHROMA_1/ STATUS	Switch on signal for NTSC chroma oscillator (3.579MHz)	V_TUNE	Tuning voltage for tuner
CHROMA_2/ STATUS	Signal to select the correct system in case of trinorma	VFB	Vertical flyback pulse
CVBS_EXT1	CVBS external 1 input signal	VFL	50 Hz vertical flyback pulse used to inform the microcomputer that flyback takes place. This is important for OSD and TXT
CVBS_EXT2	CVBS external 2 signal	VG2	Voltage on grid 2 of the picture tube
CVBS_IN	CVBS internal 1 (from tuner)	VOLUME	Control signal (from uC, but on DC level via RC network) for volume control of sound processing in sound panel
CVBS_OUT	CVBS output signal		
CVBS_OUT_1	CVBS output signal 1		
CVBS_SOUND	CVBS for inter carrier sound detector		
CVBS_TXT	CVBS for TXT processing in uc		
DISCHARGE	To have a fast discharge after switching off the set		
EAR	Earth		
EEPROM	Electrical Erasable Programmable Read Only Memory		
ESD	Electrical Static Discharge		
ff	Filament (heater voltage) from LOT to the picture tube		
FL_A	Filament voltage for CRT		
G_TXT OSD	Green TXT or OSD signal from the microcomputer to IC7225-5C		
GND	Ground		
GRD_LOT	Ground of LOT		
HOR.FLYBACK	Horizontal flyback pulse used for looking the horizontal oscillator		
12C	Digital Control bus of the microcomputer		
IF	Intermediate frequency signal for sound processing		
INT/EXT	Switching signal for Internal or external audio + video switching		
L_EXT1	Audio left external 1		
LEFT_OUT	Audio left out		
MOD_L_1N1	SCART I/P 1 in left		
MOD_L_1N2	SCART I/P 2 in left		
MOD_R_1N1	SCART I/P 1 in right		
MOD_L_1N2	SCART I/P 2 in right		
MONO/STROBE/			
BG_L	Strobe signal for HEF 4094 on multi-mono sound panel		
MONO_OUT	Audio mono out		
NTSC	NTSC colour system		
PAL/SECAM	PAL or SECAM colour system		
R_TXT OSD	Blue TXT or OSD signal from the microcomputer to the video controller IC7225C
